Mr. Gardiner Bump
Department of Conservation
Albany, New York

Dear Mr. Bump:

I noted somewhere or other that you are carrying on experiments with birds of prey to determine their method of feeding in the wild.

I might remark that the captives that I used in my work last spring did not behave typically unless they were given live prey, or at least prey so freshly killed that rigor mortis had not set in. A horned owl, for example, which normally would bite the head off the animal it had just killed, if fed one ^{dead} ~~would~~ for some time as ^{would} ~~likely~~ as not start in eating almost any place.

I trust that you will not consider it presumptuous on my part to call this to your attention. I experienced some trouble myself in this respect, so thought you might be able to use this bit of information.

Yours sincerely,

Paul L. Errington
