TOM: On 24 April in Lacey-Keosauqua SP, I saw what I believe to be a Harlan's Hawk. The bird was dark all over, including head, breast, wings, etc. When it flew I did not get good look at underside of wings, but the back was dark, as was the tail, except for whitish area on tail covert area. Wing tips were black. There was a visible terminal band on tail. The illustration in Robbins is very representative of bird I saw.
