Howdy! I feel vindicated! OK, here's the story:

It was appx. 8 am appx. December 1, 1992, when I saw the white-phase gyr(?). I was driving to work (at Kirkwood C. C.), heading west on Highway 30. As I drove over the Cedar River I looked off to the right, and there it was, sitting at the top of one of the few trees just north of the bridge on the west bank of the river. If you ever go that way, you could probably figure out what tree it was. I think the tree was a cottonwood, probably the only really tall one there. It's possible that the floods have done away with the tree, though. I liked that tree. I also saw a bald eagle in it while driving to work once.

So has the sighting of the gyr been verified? We have a gyr here in Longmont, CO, and my friend drove down to see it (30 miles) but he never found it.

Just curious. Do you know Dr. Truman Jordan, who teaches chemistry at Cornell? He's been doing some dentistry research at U of I, but now he's on sabbatical. Anyhow, he's my buddy. Just wondering.
