Sieh, J. 1957. First authentic record of Raven in Iowa. IBL 27:21-22.

**First Authentic Record of Raven in Iowa.**—One of the aerial acrobats of the wilderness was mistaken for a Crow and accidentally killed on October 7, 1956, by Art Weik of Spirit Lake (exact location: Potter's Slough, Section 23, Superior Township, Dickinson County, Iowa). Thanks to the alertness of Dr. Mary Roberts and our Editor, this specimen was obtained and delivered to Jack W. Musgrove, Museum Director of the State Dept. of History and Archives, Des Moines, who listed it as the first authentic record of a Raven recovered in Iowa. Mr. Musgrove furnished this information: "I am convinced that this bird is the Northern Raven, *Corvus corax principalis*, the specimen showing the following measurements: Length, 25 $\frac{3}{4}$  in.; wing, 17 in.; bill, 3 in.; extended wing, 51 in.—which puts this bird well within the measurement range of *principalis*. I am sorry I could not record the weight of the bird, but after that length of time, it had lost considerable weight through evaporation."

In about 1952, this writer positively identified the remains (beak, skull, and a few remaining feathers) of another Raven then in the possession of Frank Marnette (now deceased) who reported finding the dead bird in the vicinity of Spirit Lake. Writings of DuMont and Anderson indicate the species absent from Iowa for 50-70 years, and mention some of the early records as questionable. Perhaps Ravens are again occasionally visiting the Hawkeye State, and ornithologists should brush up on their field identification of the species in contrast to the common Crow. The harsh and raucous voice, the ridiculous antics of the inquisitive buffoons, and their superb playfulness in air currents endear the Raven to earthbound admirers.—JAMES G. SIEH, Biologist, Iowa Conservation Commission, Spirit Lake, Iowa.
