Nucifraga columbiana (Wilson). Clark's Nutcracker

DuMont ¹⁹³³ ~~1934~~
p 100

Accidental. This bird of the western mountains has occurred in Iowa upon three occasions, in each instance the record being substantiated by a specimen. No. 10753 in the University of Iowa Museum was shot by Cal Brown four miles south of Boone, Boone County, September 23, 1894. This specimen was donated to the Museum by Carl Fritz Henning (Nutting: Proc. Iowa Acad. Sci., 1894, p. 44). A mounted bird in the same collection was secured by A. W. Hemphill, at Tiffin, Johnson County, November 27, 1919. One in the Smith collection, Odebolt High School, was taken by H. B. Smith in Sac County.

12: Clarke's Nutcracker. *Nucifraga columbiana* (Wilson). On November 30, 1919, an adult male was taken by A. W. Hemphill, near Tiffin in Johnson county about eight miles west of Iowa City. This is a bird of the western coniferous forest areas of North America and, so far as the writer is aware, this is the second specimen recorded from the state. The first record of the occurrence of this form within our borders was published by Prof. C. C. Nutting in 1895 (Proc. Ia. Acad. Sci., II, 1894, 44). The single specimen recorded at that time was taken at Boone, September, 1894, by C. F. Henning. It is now in the collection of the museum of the State University. The specimen here recorded is deposited for the present in the University Museum. General color almost uniform gray, a little lighter on the head and without brownish tinge.
