Rock Wren

329. (715). *Salpinctes obsoletus* (Say). Rock Wren.

The Rock Wren is a Western bird which has very rarely been observed in Iowa. It was first recorded from Iowa by T. Martin Trippe, who took a specimen in October, and saw several others, in Decatur county (Proc. Bost. Soc., xv, 1872, p. 236). He states: "It was seen on several occasions, far out on the prairie, running over the ties on the railroad track, retreating, when alarmed, into the dense prairie grass" (Am. Nat., 1873, p. 566). This record is also quoted by Coues, Birds of the Colo. Val., p. 161; Birds of the N. W., p. 28; Key to N. A. Birds, p. 276; Baird, Brewer, and Ridgway, Land Birds, iii, p. 503; Cooke, Bird Migr. in Miss. Val., p. 270; Keyes and Williams, Birds of Iowa, p. 157; Goss, Birds of Kansas, p. 606.

Anderson 1907

Dr. Guy C. Rich writes from Sioux City: "The Rock Wrens were here and bred for two or three years, but I have not seen them now for several years. A nest of eggs were discovered on June 25, 1898, badly incubated. On May 28, 1899, the birds were again seen. On June 1, 1899, I saw two and possibly three birds. They sing a great deal. Found no nest, though. I thought them to be breeding. On June 10, 1900, the birds were discovered in another deep dirt-cut along railroad; no nest found. On September 15, 1901, had a bird brought in from another locality. I have also seen the measurements of two birds shot June 22, 1898."
